Dear Hiring Team,

I'm applying for the Backend Engineer role on your payments team. Most of my last three years went into exactly this kind of work: a Go and PostgreSQL API that takes money, and the on-call that comes with it.

At Acme, checkout lookups were slow enough that customers retried, and retries on the payment endpoint could charge twice. I fixed the slow path with covering indexes and a Redis cache, then added idempotency keys so a retry is always safe. The second part mattered more.

In my first months I'd want to learn your payment flows end to end, join the on-call rotation early, and look at where retries and queues can fail quietly. I'd be glad to talk.

Best regards,

**Jane Doe**
